WHY WE MAKE DOORS THIS WAY

Most doors aren't built for the conditions they face.

External doors fail because they're built like internal doors. Pivot doors twist and drop because the structure can't handle the weight. Oversized entrances drift out of true because timber alone isn't enough at that scale.

We build doors differently. We control the design, the engineering, and the manufacturing. Every door is made at our workshop at 7 Nelson Street, Moorabbin. We select the materials, we engineer the structure, and we build the door as a complete system.

The pages that follow are the doors we make. Each one designed for what it has to do, built by hand at our workshop, and finished to a standard we'd put on our own home.

Nik & Olivia Kulas

FOUNDERS · BESPOKE DOORS

ONE POINT OF CONTACT

We take care of everything, start to finish.

Most door projects mean juggling trades — someone to measure, someone to make it, someone to sort the hardware, someone to fit it. Things fall between the gaps, and the door is where it shows.

We do the lot. It starts with a site measure, so the door is built to the opening rather than forced into it. Every door is designed and manufactured at our Moorabbin workshop, with the hardware — hinges, handles, locks, the pivot system — matched to the door and the way it will be used.

From there it's supplied and installed by our skilled team at Doors Replaced, our preferred install partner. They work directly with the Bespoke workshop and know exactly how the door was built.

One point of contact from the first measure to the final adjustment. One number, one invoice, one warranty — and no managing trades yourself.

Nik & Olivia Kulas

FOUNDERS · BESPOKE DOORS

— WHAT YOU GET

Three things every architect, builder and homeowner gets when they spec a Bespoke door.

28

Days for StormBloc, deposit to install

Our StormBloc lead time. Locked in writing — 28 days from deposit paid to working door, scheduled conservatively to hit it. Architectural timber doors run 6–8 weeks; Pillar and Cirque pivots 8–10 weeks. The 28-day promise is StormBloc only.

10

Year EverFrame™ structural guarantee

Every door built with EverFrame™ internal steel reinforcement is backed by a 10-year structural guarantee. If it twists, drops or warps inside that window, we replace it. Standard on Ember, Bone, Pillar, and any door over 2340 × 920mm. The other major external-door failure point — endgrain moisture — is solved separately by RotGuard™ on the StormBloc range.

1

Point of contact, end to end

Bespoke Doors manufactures the door at our Moorabbin workshop. Installation is coordinated through our skilled team at Doors Replaced. One number, one invoice, one warranty — without managing three trades yourself.

North

Vertical lining board door

Full-length timber lining boards running vertically across a 40mm solid core. No joins, no finger joints, no interruptions. Each board runs the full height of the door in a single piece — that's what gives NORTH its clean read from the street.

Pairs with vertical cladding, timber battens, or rendered facades. Available as a hinge or pivot door in your choice of five timber species.

TIMBER
Five species: Vic Ash to Spotted Gum

Ember

Chevron pattern door

Solid timber lining boards cut and laid in opposing angles across the face. The chevron geometry catches light differently depending on the time of day and where you're standing. Morning sun reads one way, late afternoon reads another.

Built with EverFrame™ internal steel reinforcement so the opposing angles stay true. Timber alone won't hold a chevron straight over time.

Even

Batten overlay door

Solid timber battens applied at consistent spacing across a 40mm core. The gaps between battens cast shadow lines that shift throughout the day — the same door looks noticeably different at 8am and 4pm.

The most contemporary door in the range. Works with rendered facades, brick, weatherboard, or concrete. Vision panel option slots light into the entry without breaking the batten rhythm.

AVAILABLE AS A HINGE OR PIVOT DOOR

Bone

Herringbone pattern door

Herringbone pattern built from solid timber lining boards, each piece cut and laid by hand at opposing angles. Quiet rhythm, refined detail. The kind of door that rewards a second look from the street.

Built with EverFrame™ internal steel reinforcement to hold the herringbone geometry true over time.

Weave

Mixed species batten door

Two timber species alternating across the face in a batten overlay. The contrast between species creates depth and texture that changes as the light moves — Vic Ash reads warm against Spotted Gum, American Oak shifts against Wormy Chestnut. Pick any two from the range.

Every Weave is a one-off. No two species pairings look the same, and no two doors will match. Built on a 40mm solid core with applied batten overlay.

AVAILABLE AS A HINGE OR PIVOT DOOR

North with Halo

A vertical vision panel, available on every timber door.

HALO is a full-height glazed panel that sits flush alongside the door leaf. It brings natural light into the entrance without compromising the architectural surface across the rest of the door.

Shown here on NORTH in Vic Ash. Available on every door in our timber range — EMBER, BONE, EVEN and WEAVE — in clear or frosted glass.

Standard sizes 2040 × 820, 2040 × 920, 2340 × 820 and 2340 × 920 mm. Every door in the range can be built to custom sizes — tell us the opening and we'll build to suit.

StormBloc

Weather-resistant engineered door system.

A weather-resistant engineered door designed for Australian conditions. Pre-finished Colorbond steel skins over an engineered core built for stability. No painting, no maintenance, no replacing every few years.

Three variations: StormBloc solid panel, Vision Panel with a full-height glazed strip, and Half-Lite with an upper glass panel. Edge Capping can be added for high-exposure sites.

Ten years of repainting and replacing a builder-grade external door costs more than one StormBloc. Built in Moorabbin on a 28-day lead time, in 23 Colorbond finishes including Zincalume®.

Pillar

Thermally modified spruce pivot door.

Built from Thermory Ignite thermally modified spruce cladding, sourced through City Timber. Thermally treated at high heat, this profile takes a deep black finish without warping, cupping or movement — the problem that rules out most softwoods for ebony finishes.

Jambs, mullions and header are all clad in the same profile so the black doesn't break at the door edge. Built with EverFrame™ steel reinforcement, made to take a FritsJurgens pivot system and a full-height brass bar handle, quoted to suit.

Installation coordinated through Doors Replaced — the precision a pivot of this kind demands.

Cirque

Available in every Porta Contours profile.

Porta Contours lining boards have become one of the most sought-after interior surfaces in Australian homes — walls, bulkheads, bedheads, joinery panels, concealed doorways. Until now nobody had built a full-scale entrance door from them.

Bespoke Doors is the first in Australia to adapt the range into pivot doors. The profile used as wall cladding on a project can now continue across the entrance, so the timber language doesn't stop at the frame.

Cirque shown here. Every other profile available on request in Tasmanian Oak, Clear Pine or pre-primed finger-jointed pine. Built with EverFrame™ reinforcement; jamb, pivot hardware and install are quoted to suit.

Isthmus

Narrow linear profile pivot door.

Porta Timber lining board in a narrow linear profile — finer boards, deeper rebates, tighter joinery. Where Cirque catches the light, Isthmus reads as a series of vertical lines that catch the shadow.

This is the quiet door of the bespoke pivot range. Refined rather than declarative, it sits well in considered architecture — where the entrance is part of the composition rather than the focal point.

Built 60–80mm thick with EverFrame™ steel reinforcement and a FritsJurgens pivot system. Jamb in matching timber, pivot hardware and install quoted to suit.

CUSTOM DOORS

Custom Doors. Built for your project.

If you like what you've seen but the exact door you're looking for isn't on these pages, we build custom doors to suit the application. A door you've sketched. A door an architect has specified. A door that has to fit an opening no standard product covers.

We work with architects, designers, homeowners, and builders to reach the result they're after — from a single replacement front door to a full door schedule across a build. Across materials too: solid timber, veneer, aluminium, composite — whatever the project calls for. Every custom door is engineered for its specific opening and built at our Moorabbin workshop.

When installation is part of the brief, it's coordinated through our skilled team at Doors Replaced. They work directly with the Bespoke workshop, get the full scope of works, and know exactly how the door was built — one number, one warranty, no managing trades yourself.

Quoted to your project

STARTING AT · SOLID TIMBER, VENEER, ALUMINIUM OR COMPOSITE · ARCHITECTS, DESIGNERS, HOMEOWNERS, BUILDERS

— FROM ENQUIRY TO ENTRY

Three steps. No surprises.

1

Send photos and measurements

Email or text us photos of the existing opening and rough measurements (height, width, jamb depth). Plans or sketches if you have them. The Bespoke team works the door spec; Doors Replaced costs the install. No site visit needed yet.

2

Quote within 48 hours

Email proposal with options — standard timber, StormBloc, custom. One locked number per option, including the door (manufactured by Bespoke) and the install (coordinated through our skilled team at Doors Replaced). No surprises later.

3

Site visit, then built and installed

Once you're happy with scope and price, the Doors Replaced team confirms final measurements and details on site. The door is manufactured at the Bespoke Moorabbin workshop; installation is then coordinated through our skilled team at Doors Replaced — 28 days for StormBloc, 6–8 weeks for architectural timber, 8–10 weeks for Pillar & Cirque pivots.

— WHY OUR DOORS HOLD UP

Three proprietary systems do the heavy lifting.

S

StormBloc™

A weather-resistant engineered door built for Australian conditions. Pre-finished Colorbond steel skins over an engineered core. No painting, no maintenance, no replacing every few years.

R

RotGuard™

A perimeter sealing system that wraps the four edges of the doors that need it. Stops moisture wicking into endgrain — the failure point that kills most external timber doors within five years.

E

EverFrame™

Internal steel reinforcement built into pattern doors and oversized openings. Stops the door twisting, dropping or warping over time. Standard on every Ember, Bone and Pillar, and any door over 2,340 × 920 mm.

— REAL PROJECTS

Doors built for real homes, real builds, real conditions.

BLACK ROCK, BAYSIDE

Entrance Transformation

Tired 1980s entry rebuilt as a contemporary architectural entrance. Custom timber door, jamb and sidelight built as one system and installed in a day.

MORNINGTON

American Oak Lining Board

Full-length American Oak lining boards across a NORTH entry. Premium grain, clean vertical read, no joins anywhere on the face.

DONCASTER

Architectural Front Entrance

Replaced a dated façade entry with a full-height architectural door and integrated sidelight. The entrance now sets the tone for the whole front elevation.

— VISIT THE WORKSHOP

Come and see what we're building.

Most doors get picked off a screen. Ours are built to be experienced in person. Operate working pivot doors, feel the weight of an oversized entrance, compare timber species side by side, and see how EverFrame™ and StormBloc™ are actually constructed.

Saturdays we're open to the public. No appointment needed. Bring your plans, your builder, your architect — or just come through and have a look.

READY WHEN YOU ARE

Five ways to get this started.

You've seen the range. The next step takes a phone call, an email, or thirty minutes at our Moorabbin showroom. Architects, builders, designers, homeowners — we work with all of them, the same way.

Whichever way you reach out, you'll talk to Nik or Olivia. No call centre, no sales pipeline, no chasing.

— WHO WE WORK WITH

The companies behind our doors.

Bellevue Architectural

Principal FritsJurgens distributor in Australia. Our direct partnership gives us access to the full pivot system range and specialist technical support.

City Timber

Specialist timber supplier. Our Pillar pivot door is built from Thermory Ignite 5 Spruce, sourced exclusively through City Timber.

N2LOK

Architectural door hardware. Handles, pulls and locking systems available across the Bespoke Doors range.

FritsJurgens

Precision pivot hardware from the Netherlands. Used exclusively across every pivot door we build.

Colorbond®

Pre-finished steel skins across the full StormBloc™ range. 23 standard colours, Australian-manufactured.

Porta Timber

Australian timber supplier. Our Cirque and Isthmus pivot doors are built from their lining board profiles — the first in Australia to adapt these products into full-scale entrance doors.

Zanda Architectural Hardware

Australian door hardware supplier. Handles, locks, and architectural hardware across the Bespoke Doors range.

BESPOKE DOORS

Designed, engineered and built in Moorabbin.
